IRIS · INTEGRATED REPORTING INTERVENTION SYSTEM

What is built right now

Every screen of the current prototype, as each role sees it, with a count of how much is on each one, to help decide where the design should be simplified.

Captured 24 Oct 2026, 16:10 (PHT) from branch **integration**, commit bbb6119 plus uncommitted changes.
Desktop screens at 1280 × 800 px; phone screens at 390 px. Demo data as it currently stands in the local database (not reset).
32 screens in 7 groups.

How to read this document

Each screen has a short note on what it is for, the address, the role it was captured as, a row of counts, and the full screenshot. Long pages continue over several PDF pages.

Screens tall	Page height divided by the window height (800 px). 1.0 = fits without scrolling.
Words	Visible words in the page body (the top bar and footer are not counted).
Boxes	Card or panel containers.
Charts	Charts and graphs, including the network graph.
Tables	Visible tables (data-table toggles that are closed are not counted).
Clickable	Buttons, links, tabs and expanders the user can press.
Inputs	Drop-downs, text boxes and other form fields.
Badges	Small coloured status labels.

For a detail panel (drawer), the counts cover the panel only. The counts are a rough guide to how busy a screen is, not a quality score.

Navigation

- **Dashboard**: Dashboard · Dashboard (RHU staff)
- **Reports & Analysis**: Reports · Trends · What's missing · About this data · Anomaly analysis · Zero reports · zero report detail · Low counts · Weekly plan · How well it works · Recovery
- **Reporting Network**: Reporting network · unit selected
- **Investigations & Actions**: Investigation queue · Summary · Week by week · Plan actions · Follow-up · action open
- **Data & Models**: Datasets · Dataset detail · Reporting units (admin) · System activity (admin) · Import dataset · Evaluation
- **Settings & Help**: Settings · Help

Roles: RHU staff (report and respond), provincial coordinator and RESU analyst (review, plan, follow up), administrator (data and units). Real dengue data is open to coordinators, RESU analysts and administrators; only coordinators and analysts can record reviews.

Busiest screens first

Desktop screens sorted by clickable items plus badges: the things competing for attention. The bar shows that total.

Screen	Screens tall	Words	Boxes	Charts	Tables	Clickable	Inputs	Badges

How IRIS works

1. **Review** — Open a concern to see why it was flagged.
2. **Verify** — Confirm it with the unit, or close it as not a problem.
3. **Act** — Choose what to fix first within your staff time.
4. **Check recovery** — See whether reporting improved afterwards.

Reports | Trends | What's missing | About this data

Missing values versus confirmed zeros

'Zero' means the unit explicitly reported zero cases. 'Blank' means the field was left empty. 'Not received' means an expected report did not arrive.

Status	Count	Meaning
Not received	126	Expected report did not arrive
Reported	1,367	A count greater than zero.
Zero reported	557	The unit explicitly reported zero.
Blank	22	The field was left empty. Not the same as zero.
Late	182	Received after the due date
Duplicate records	0	Same unit/area, category and period (whole dataset)

Field missingness

Among 1,946 received records.

Field	Missing	Share missing
Reported value	22	1.1%
Received timestamp	0	0.0%
Due date	0	0.0%
Reporting unit	0	0.0%
Geographic area	0	0.0%
Category	0	0.0%

By reporting unit

Sorted by not-received plus blank values.

Reporting schedule defined
Yes — completeness can be calculated
Due/received timestamps
Yes
Known limitations
All units, places and relationships are fictional.
Disruptions were injected deliberately to demonstrate the workflow; their frequency is not realistic.
Reports received after the snapshot date are treated as not yet received.
Case counts follow simple seasonal Poisson patterns and are not epidemiological estimates.
Data dictionary
Field
Label
Description
reporting_unit_id
Reporting unit
Simulated reporting unit that submitted the report.
category_code
Reporting category
Disease or reporting category (see Settings → Help for definitions).
period_start / period_end
Reporting period
Monday–Sunday for weekly categories; calendar month for monthly summaries.
value
Reported value
Count reported by the unit. Empty when the field was left blank.
value_status
Value status
reported (>0), zero (explicit zero report) or blank (field left empty). Blank is never treated as zero.
due_at
Due date
Weekly: Tuesday 17:00 after the week. Monthly: the 5th of the next month, 17:00.
received_at
Received
When the report arrived (simulated). Missing reports have no record.
fields_complete
Form completeness
Share of required form fields completed (0–1).

Weekly reports | Anomaly analysis | Real dengue data | Recovery

Anomaly Analysis

Detect suspicious reporting patterns and examine supporting evidence.

DS-DEMO-FACILITY

Synthetic reporting dataset. Detection scans the whole dataset; the list below shows flags in your reporting scope.

Check for new concerns

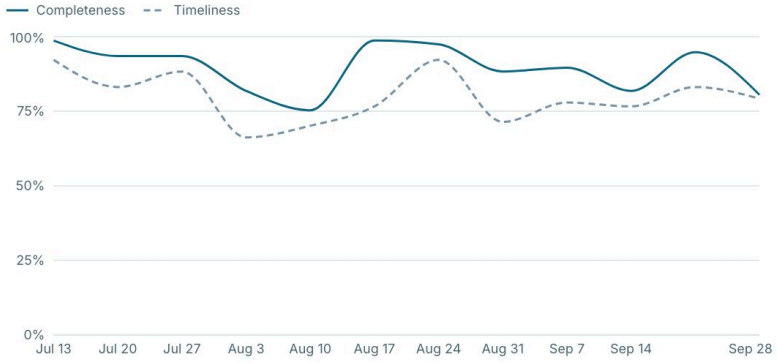

Reporting completeness and timeliness

Observed across your reporting scope, latest 12 weeks. Completeness = reports received ÷ expected; timeliness = received by the due date ÷ expected.

Reporting unit (chart and list)

Reporting scope overview

Choosing a unit does not change what detection scans. Weeks with no data are left as gaps, not drawn as zero.

Show data table

How flags are raised

Statistical threshold
Robust historical threshold comparison.

Time-series (EWMA)
Exponentially weighted reporting signal.

Network-aware
Reporting signal with connected-peer support.

A flag is a prompt for review, not a confirmed problem. A shared connection is a possible explanation, never a proven cause; a person verifies each one.

Flagged for review

Being fixed · High priority

Possible shared problem — Kalinaw RHU I and Kalinaw RHU II (shared encoder/connection)

Method: Network-aware
Period: Aug 31 – Sep 20, 2026
Shared dependency: the shared connection of Kalinaw RHU I and Kalinaw RHU II
Verification: Confirmed by reviewer

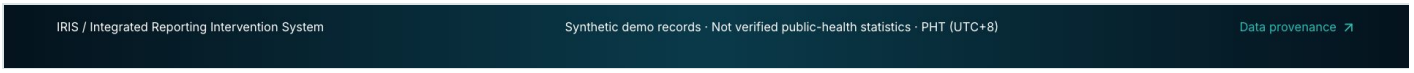

2 connected units were delayed in the same weeks

0 of 20 expected weekly reports were on time; 0 were late and 20 were not received by the review date.

Unit	Expected	On time	Late
Kalinaw RHU I	8	0	0
Kalinaw RHU II	12	0	0

Detection method: Network-aware. Peak score 9.7. Scores describe how unusual the reporting pattern is compared with the unit's own recent history; they are not probabilities and do not prove a reporting failure. The grouping uses relationships defined in the simulated network only. Baseline: the unit's previous 8 weeks.

▸ ABOUT THIS DATA

Zero reports | Low counts | Weekly plan | How well it works

Model B: ranking real reporting problems (average precision)

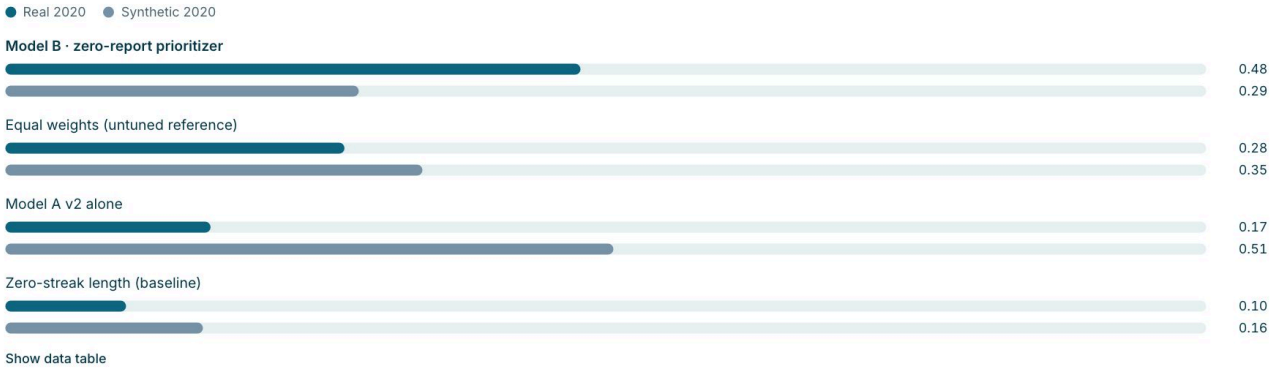

Test on real 2020 data, not used to build the model: 157 known problems (zeros swapped in the source records) among 1367 zero reports. 1.0 would mean every problem ranked above every genuine zero.

Show data table

Real versus simulated test, 2020 (average precision)

The same methods on real 2020 problems and on failures simulated into 2020. These are separate experiments and are not combined. Model B leads on the real test but not on the simulated one.

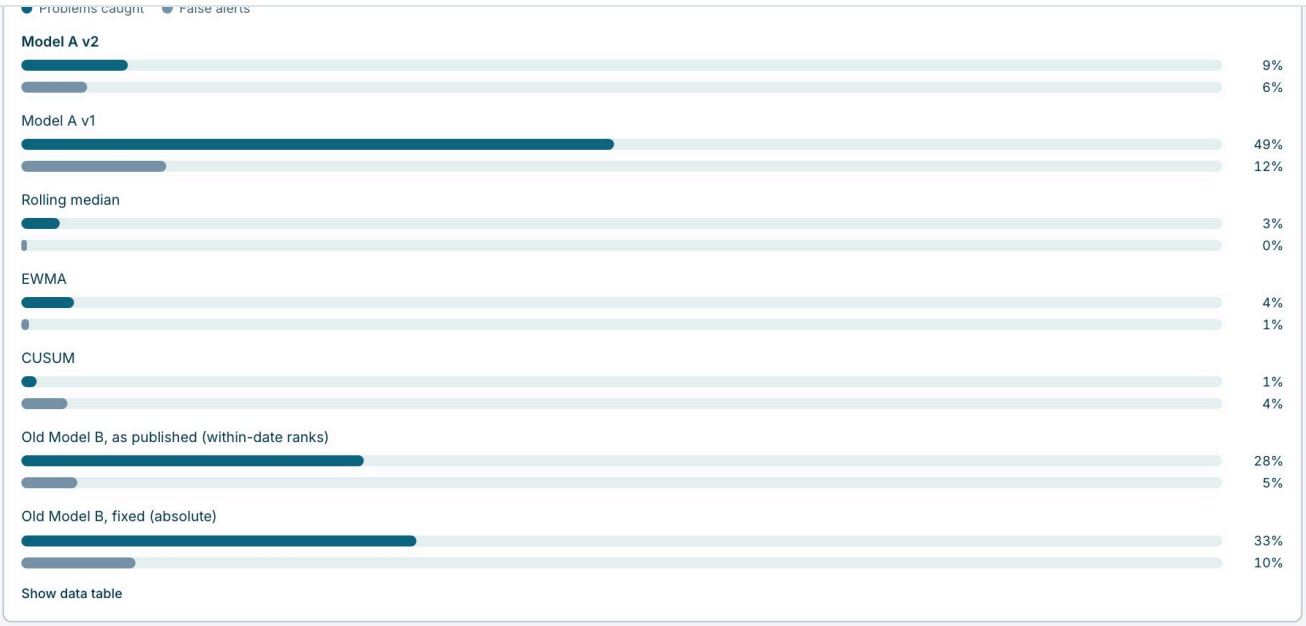

Show data table

WHY 2020 HAS MORE FALSE ALERTS

47% of genuine zero reports in 2020 reached High priority, against 5% in 2019. During COVID-19 many places in the same region reported zero together (36% on average, against 3%), and the model reads that as a sign of a shared reporting problem.

Model A: catching real problems vs raising false alerts

Real 2020 data. A good method catches many problems (long first bar) with few false alerts (short second bar).

Project objectives

Tap an objective for the evidence.

Investigation brief

C-0010 | POSSIBLE SHARED PROBLEM

Possible shared problem — Kalinaw RHU I and Kalinaw RHU II (shared encoder/connection)

In weeks 36–38 (Aug 31 – Sep 20, 2026), 2 connected units had late or missing reports at the same time: 20 of 20 expected weekly reports were not received and 0 were late.

Detection method: Network-aware. Peak score 9.7. Scores describe how unusual the reporting pattern is compared with the unit's own recent history; they are not probabilities and do not prove a reporting failure. The grouping uses relationships defined in the simulated network only. Baseline: the unit's previous 8 weeks.

Kalinaw RHU I	✓	✓	✓	✓	×	×	✓	✓
Kalinaw RHU II	✓	✓	✓	×	×	×	×	×

✓ All on time · Some late · × Some missing · ½ Forms incomplete · Weeks in this concern

Evidence behind the flag

2 connected units were delayed in the same weeks

0 of 20 expected weekly reports were on time; 0 were late and 20 were not received by the review date.

Unit	Expected	On time	Late	Not received
Kalinaw RHU I	8	0	0	8
Kalinaw RHU II	12	0	0	12

Confirmed by reviewer — Confirmed by Malaya Provincial Coordinator (demo)

Both Kalinaw RHUs confirmed their shared internet connection has been down (simulated).

Recorded by Malaya Provincial Coordinator (demo)

Not yet known: possible explanations and what to check

These are possibilities, not facts. A person needs to check them.

Possible explanation — Possible shared problem

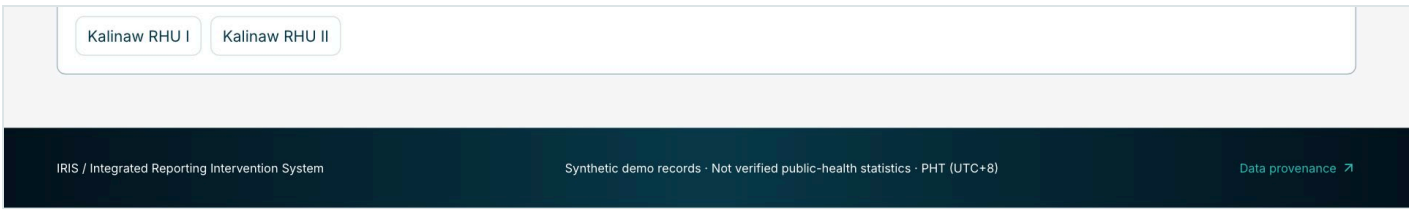

A disruption affecting the shared connection of Kalinaw RHU I and Kalinaw RHU II (for example connectivity, an encoding backlog or staff absence) could explain simultaneous delays. The relationship is defined in the simulated network; the cause has not been verified.

Requires verification — Confirm the cause with the hub and at least one unit

Check whether consolidated submissions were delayed upstream, and ask an affected unit whether its reports were prepared on time.

Units involved (2)

Known limitations

- All units, places and relationships are fictional.
- Disruptions were injected deliberately to demonstrate the workflow; their frequency is not realistic.
- Reports received after the snapshot date are treated as not yet received.
- Case counts follow simple seasonal Poisson patterns and are not epidemiological estimates.

Data dictionary

Field	Source column	Label	Description
reporting_unit_id	—	Reporting unit	Simulated reporting unit that submitted the report.
category_code	—	Reporting category	Disease or reporting category (see Settings → Help for definitions).
period_start / period_end	—	Reporting period	Monday–Sunday for weekly categories; calendar month for monthly summaries.
value	—	Reported value	Count reported by the unit. Empty when the field was left blank.
value_status	—	Value status	reported (>0), zero (explicit zero report) or blank (field left empty). Blank is never treated as zero.
due_at	—	Due date	Weekly: Tuesday 17:00 after the week. Monthly: the 5th of the next month, 17:00.
received_at	—	Received	When the report arrived (simulated). Missing reports have no record.
fields_complete	—	Form completeness	Share of required form fields completed (0–1).

Data quality

1,367 reported · 557 zero · 22 blank values

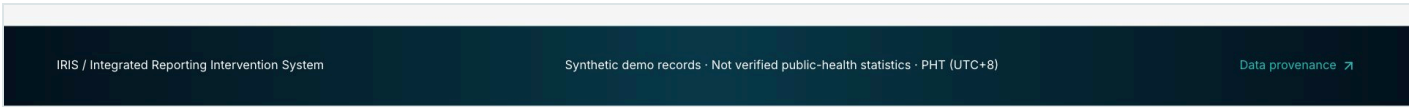

126 expected reports not received · 182 late

SYNTHETIC LABELED REPORTING DISRUPTIONS

Demo setup evaluation (20 replications)

All three implemented detection methods use identical simulated inputs and known disruption labels.
These results are not validation against real surveillance operations.

E-0001 | 20 replications | base seed 7100 | 26 reporting weeks per replication | 10,400 unit-weeks per method.

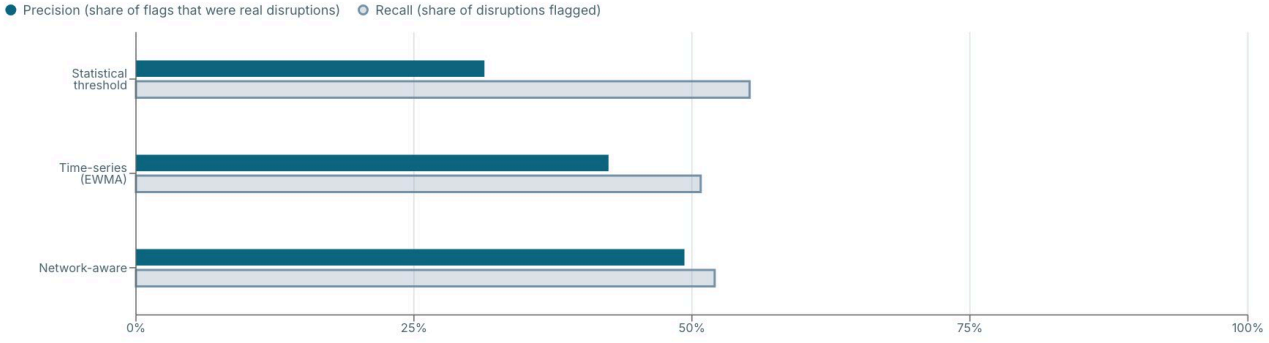

Metric card method: Network-aware

The four numbers below are for the method chosen here, in this simulated test.

Precision	Recall	F1 score	False-alarm rate
49.3%	52.0%	0.507	3.48%
331 true positives / 671 flagged unit-weeks.	331 detected / 636 disrupted unit-weeks.	Balance of precision and recall (0 to 1).	340 false flags / 9,764 normal unit-weeks.

Detection method comparison

Simulated test: the same synthetic data and known disruptions for every method. Higher is better for both. A method with no value is left out of the bars and shown as — in the table.

Accessible numerical comparison follows. These methods are statistical detectors, not trained predictive models.

Metric	Statistical threshold	Time-series (EWMA)	Network-aware
Precision higher is better	31.3%	42.5%	49.3%
Recall higher is better	55.2%	50.8%	52.0%
False-alarm rate lower is better	7.88%	4.48%	3.48%
F1 score higher is better	0.400	0.463	0.507
Events detected	77.6%	69.6%	74.4%

unit-level disruption episodes

Median detection delay weeks after start; lower is better	0.0 wk	0.0 wk	0.0 wk
Mean detection delay weeks, detected events only	0.39 wk	0.51 wk	0.44 wk
True / false positives unit-weeks	351 / 769	323 / 437	331 / 340

About this test run

Detection method definitions

Each unit-week counts once. A week is a labeled disruption only if the simulation injected one; holiday delays and real outbreaks are not.

Statistical threshold: Compares each week's share of late or missing reports with the unit's own recent median and spread.

Time-series (EWMA): Smooths the same signal over time (exponentially weighted moving average) to catch sustained shifts.

Network-aware: Threshold evidence plus support from connected units (same hub or shared resource) delayed in the same week.

Glossary Status labels Metrics Detection methods Intervention planning Limitations

Glossary

Reporting unit	A facility that submits reports: a Rural Health Unit (RHU), hospital or laboratory. In this demo all units are simulated.
Reporting hub	A simulated point through which several units submit their reports (for example a provincial office).
Expected reports	The reports a unit should submit, defined by its reporting schedule (category and frequency). Missing reports can only be counted when expected reports are defined.
Late report	A report received after its due date (weekly: Tuesday 17:00 after the reporting week; monthly: the 5th of the next month).
Missing / not received	An expected report that had not arrived when the week was reviewed (seven days after the due date) or by the dataset snapshot.
Blank versus zero	A *zero* is an explicit report of no cases. A *blank* is a field left empty. IRIS never treats a blank as zero.
Possible shared problem	Several connected units (same hub or shared resource) had delays at the same time. It suggests, but does not prove, a common cause.
Unexpected drop in counts	Reported cases much lower than the unit's recent weeks while reports were still being received. It may reflect under-reporting, a data-entry error or a genuine decline.
Concern	A flagged reporting issue that needs review. Concerns are created by detection runs and closed by a person.
Recommended next step	A suggestion based on the concern type and status. IRIS never acts automatically.

Status labels

Concern status

New	Flagged by detection; nobody has looked at it yet.
Being reviewed	Someone is checking the evidence.
Waiting for reply	A question was sent to the reporting unit.
Being fixed	Confirmed or assigned; someone is working on it.
Resolved	Closed with a summary of what was done.
Not a problem	Closed as a false alarm, with a reason.

Evidence labels

Observed in dataset	A fact computed directly from the records.
Possible explanation	A hypothesis. It has not been verified.
Requires verification	Something a person needs to check.
Confirmed by reviewer	A reviewer recorded this with a reason.
Attached by reviewer	Evidence a person attached: a description and, optionally, a link.
Simulated example	Comes from the simulation, not real data.

Value status

Reported	A count greater than zero.
Zero reported	The unit explicitly reported zero.
Blank	The field was left empty. Not the same as zero.

Follow-up action status

Follow-up action status

Not started	
In progress	
Done	
Closed	
Cancelled	
Outcome not yet verified	The action was completed but nobody has checked whether reporting improved.
Outcome observed (unverified)	A change was seen in the data, but a reviewer has not confirmed it or its cause.
Outcome verified by reviewer	A coordinator or analyst explicitly recorded the outcome as verified.
Simulated outcome	The outcome was produced by the demo storyline, not by real reporting.

Metrics

Completeness	Received expected submissions ÷ total expected submissions. Not calculable when a dataset defines no reporting schedule.
Timeliness	Submissions received by the due date ÷ total expected submissions. Requires due dates and received timestamps.
Delay share (detection)	(½ × late reports + reports not received) ÷ expected reports, for one unit in one week.
Precision	Of the unit-weeks a method flagged, the share that were truly disrupted in the simulation.
Recall	Of the truly disrupted unit-weeks, the share the method flagged.
False-alarm rate	Of the undisrupted unit-weeks, the share the method flagged.
Detection delay	Weeks from the start of a disruption to the method's first flag for that unit.
95% CI	Wilson score interval for a proportion. It describes sampling uncertainty only, not bias.

Detection methods

Statistical threshold	Compares the week's delay share with the unit's previous eight weeks (median and a robust spread; at least six weeks needed, otherwise a network-wide default is used). Flags when the robust z-score is ≥ 3 and the delay share ≥ 30%.
Time-series (EWMA)	An exponentially weighted moving average (λ = 0.5) of the delay share, compared with the same baseline. Catches sustained shifts and ignores many one-off late weeks, but can stay elevated just after a problem ends.
Network-aware	The threshold z-score plus 3 × the share of connected units (same hub or shared resource) that were also delayed. Flags at a combined score ≥ 4.5, and only with some delay of the unit's own. Only relationships defined in the selected dataset are used.
Shared checks	All methods also flag incomplete records (≥ 50% of received reports with blank or incomplete fields) and count drops (Poisson lower-tail probability < 0.001 versus recent weeks, only when most reports arrived).
Scores	Scores describe how unusual a pattern is. They are not probabilities and do not prove a reporting failure.

Intervention planning

Assumed benefit	Expected weekly reports at the affected units × planning horizon × assumed success probability, in report-weeks. An illustrative simulation assumption.
Optimized plan	Exact budget-constrained selection (multiple-choice knapsack) that maximizes assumed benefit and respects dependencies.
Baseline plan	Takes actions in priority order (concern severity) while they fit the budget.
Approval	Approving a plan creates follow-up actions. No facility is contacted and nothing happens outside the prototype.

Prototype and data limitations

- IRIS is a research prototype. It is not an officially deployed Department of Health system and is not endorsed by any government agency.
- All demonstration data, places, facilities, people and relationships are simulated. Province and municipality names are fictional.
- No real patient information is used. The demo contains only aggregate simulated counts.

- No real patient information is used. The demo contains only aggregate simulated counts.
- Detection thresholds and planning assumptions were set for the simulation; they have not been validated on real surveillance data.
- Evaluation results come from synthetic scenarios with known answers and may not reflect real-world performance.
- Before/after comparisons show association, not causation.
- The demo role selector is not authentication. Anyone can act as any role.
- Data is stored in a local SQLite file; staged CSV uploads are kept in server memory and are lost if the server restarts.
- Imported data is labelled with the origin the importer declares; IRIS does not verify it.

Investigation brief
C-0010 | POSSIBLE SHARED PROBLEM
Possible shared problem — Kalinaw RHU I and Kalinaw RHU II (shared encoder/connection)
In weeks 36–38 (Aug 31 – Sep 20, 2026), 2 connected units had late or missing reports at the same time: 20 of 20 expected weekly reports were not received and 0 were late.
Detection method: Network-aware. Peak score 9.7. Scores describe how unusual the reporting pattern is compared with the unit's own recent history; they are not probabilities and do not prove a reporting failure. The grouping uses relationships defined in the simulated network only. Baseline: the unit's previous 8 weeks.
Affected units
Kalinaw RHU I, Kalinaw RHU II

Notes & history (1)

Investigation (phone) — continued (2 of 2)

All on time · Some late · Some missing
½ Forms incomplete · Weeks in this concern

Evidence behind the flag

2 connected units were delayed in the same weeks

0 of 20 expected weekly reports were on time; 0 were late and 20 were not received by the review date.

Unit	Expected	On time
Kalinaw RHU I	8	0
Kalinaw RHU II	12	0

Confirmed by reviewer

Confirmed by Malaya Provincial Coordinator (demo)

Both Kalinaw RHUs confirmed their shared internet connection has been down (simulated).

Recorded by Malaya Provincial Coordinator (demo)

Not yet known: possible explanations and what to check

These are possibilities, not facts. A person needs to check them.

Possible explanation **Possible shared problem**

A disruption affecting the shared connection of Kalinaw RHU I and Kalinaw RHU II (for example connectivity, an encoding backlog or staff absence) could explain simultaneous delays. The relationship is defined in the simulated network; the cause has not been verified.

Requires verification

Confirm the cause with the hub and at least one unit

Check whether consolidated submissions were delayed upstream, and ask an affected unit whether its reports were prepared on time.

Units involved (2)

Connected through the shared connection of Kalinaw RHU I and Kalinaw RHU II.

Kalinaw RHU I · Kalinaw RHU II
